

# Laplacian and Blob Detection

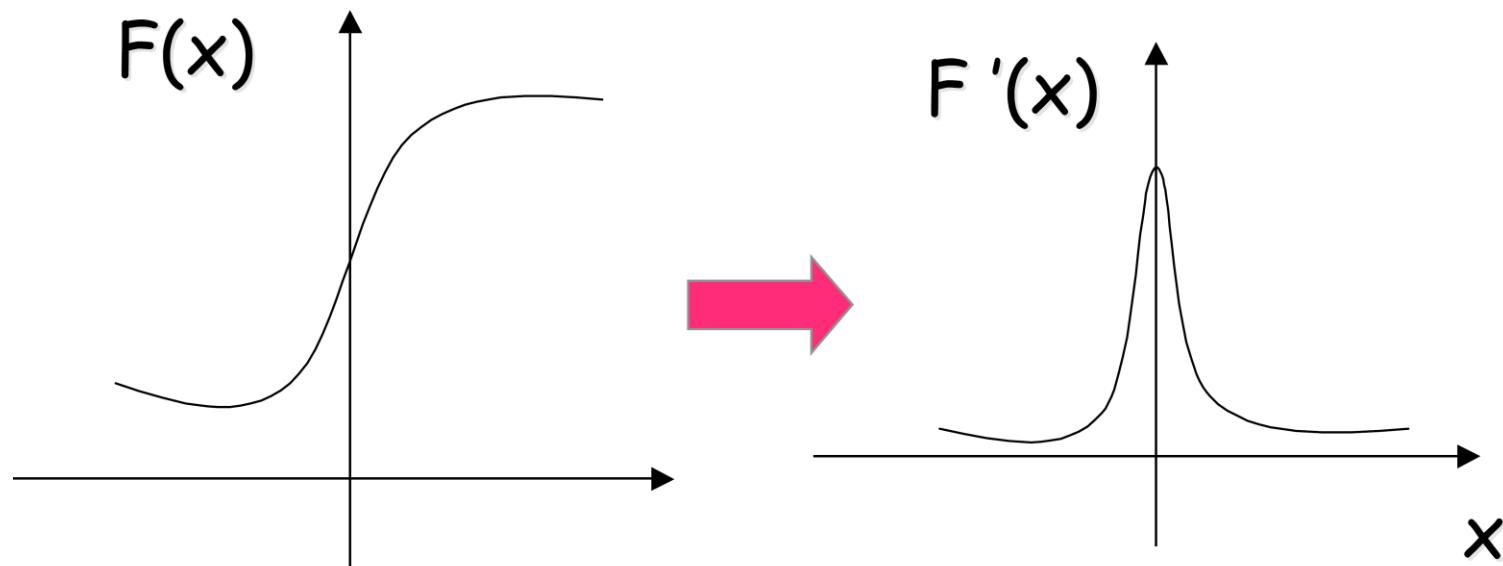

CS 4391 Introduction Computer Vision

Professor Yu Xiang

The University of Texas at Dallas

# Recall: First Derivative Filters

- Sharp changes in gray level of the input correspond to “peaks or valleys” of the first-derivative of the input signal

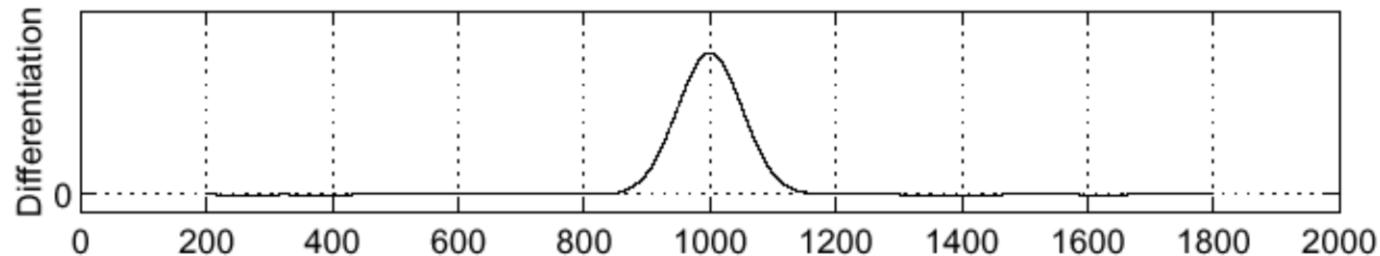

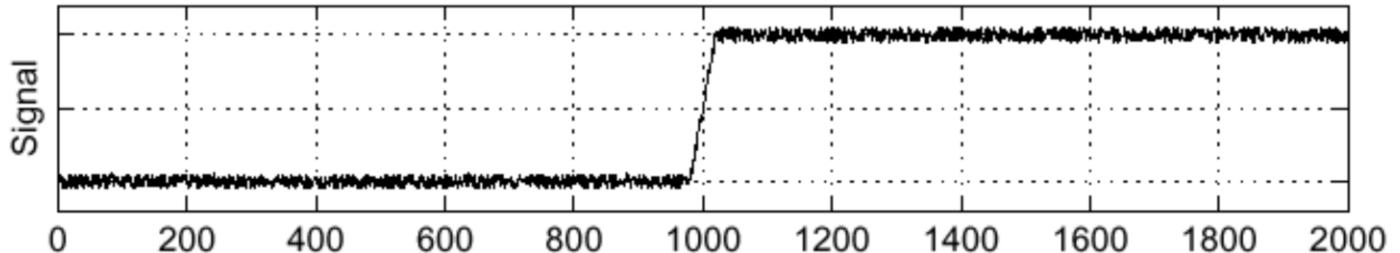

# Recall: First Derivative Filters

- Central difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + 0.5h) - f(x - 0.5h)}{h}$$

-1	0	1
----	---	---

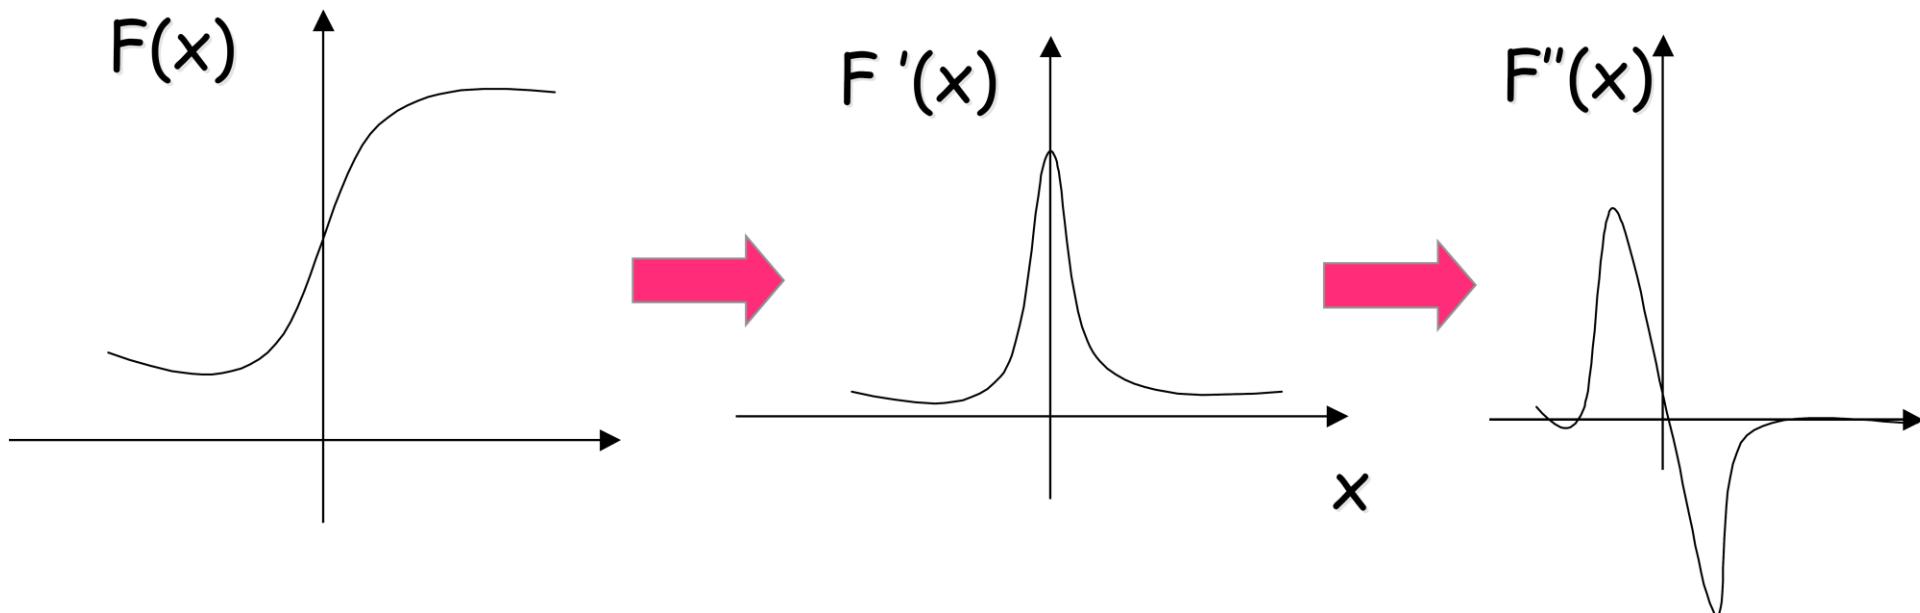

X derivative filter

Find edge

# Second Derivative Filters

- Peaks or valleys of the first-derivative of the input signal, correspond to “zero-crossings” of the second-derivative of the input signal

# Second Derivative Filters

- Taylor series expansion

$$f(x+h) = f(x) + hf'(x) + \frac{1}{2}h^2 f''(x) + \frac{1}{3!}h^3 f'''(x) + O(h^4)$$

add

$$+ \left[ f(x-h) = f(x) - hf'(x) + \frac{1}{2}h^2 f''(x) - \frac{1}{3!}h^3 f'''(x) + O(h^4) \right]$$

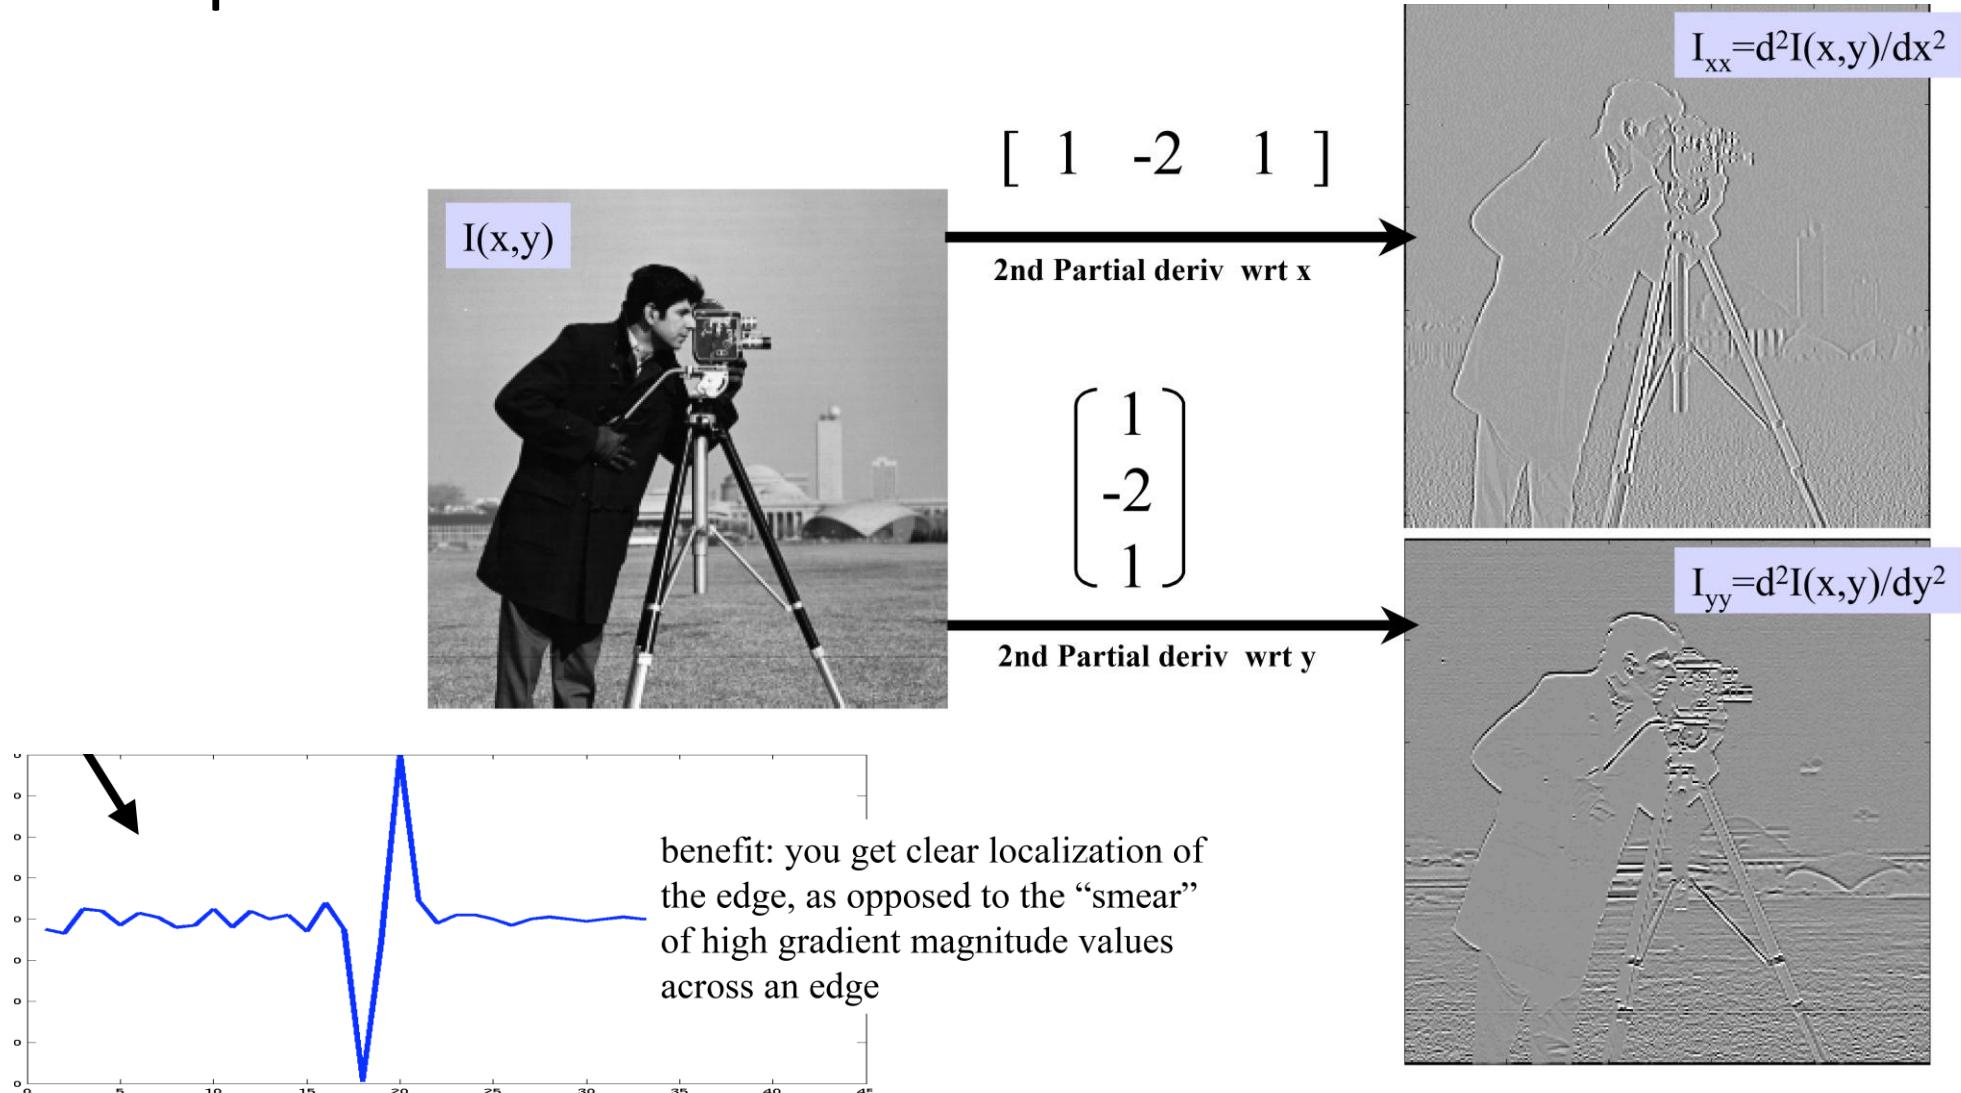

$$f(x+h) + f(x-h) = 2f(x) + h^2 f''(x) + O(h^4)$$

$$\frac{f(x-h) - 2f(x) + f(x+h)}{h^2} = f''(x) + O(h^2)$$

1	-2	1
---	----	---

Central difference approx  
to second derivative

# Example: Second Derivatives

# Edge Detection with Second Derivative Filters

- Find zero-crossings in second derivate
- In 1D, convolve with  $[1 -2 1]$  and look for pixels where response is (nearly) zero?
- In 1D, convolve with  $[1 -2 1]$  and look for pixels where response is nearly zero AND magnitude of first derivative is “large enough”.

# Laplace Filter

first-order  
finite difference

$$f'(x) = \lim_{h \rightarrow 0} \frac{f(x + 0.5h) - f(x - 0.5h)}{h}$$

Derivative filter

-1	0	1
----	---	---

second-order  
finite difference

$$f''(x) \approx \frac{\delta_h^2[f](x)}{h^2} = \frac{\frac{f(x+h) - f(x)}{h} - \frac{f(x) - f(x-h)}{h}}{h} = \frac{f(x+h) - 2f(x) + f(x-h)}{h^2}$$

1D Laplacian filter

1	-2	1
---	----	---

# Laplace Filter

- 2D

$$I_{xx} + I_{yy} = \left( [1 \ -2 \ 1] + \begin{bmatrix} 1 \\ -2 \\ 1 \end{bmatrix} \right) * I$$

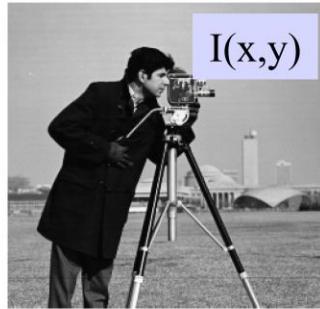

$$\nabla^2 \mathbf{I} = \frac{\partial^2 \mathbf{I}}{\partial x^2} + \frac{\partial^2 \mathbf{I}}{\partial y^2}$$

$$= \underbrace{\begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix}}_{\text{Laplacian filter } \nabla^2 \mathbf{I}(x,y)} * I$$

0	1	0
1	-4	1
0	1	0

2D Laplace filter

# Example: Laplacian

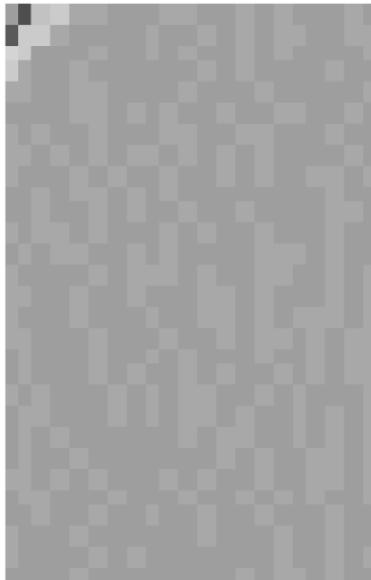

$$\begin{bmatrix} 0 & 1 & 0 \\ 1 & -4 & 1 \\ 0 & 1 & 0 \end{bmatrix} * I$$

# Example: Laplacian

I<sub>xx</sub>

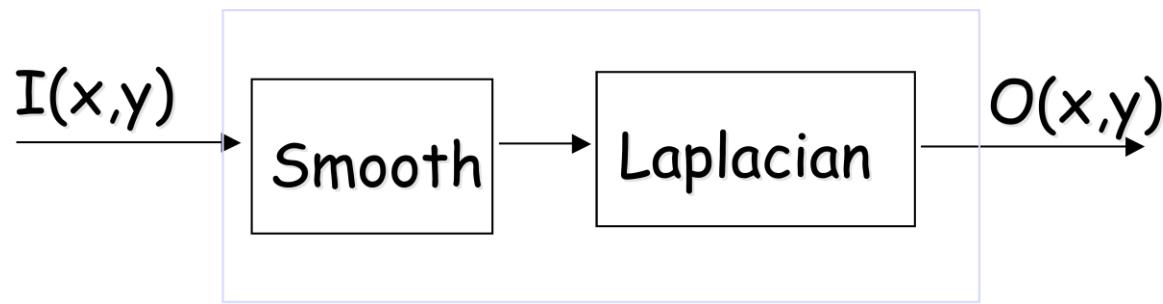

I<sub>yy</sub>

$$\begin{aligned} & I_{xx} + I_{yy} \\ & \nabla^2 I(x,y) \end{aligned}$$

# More about Laplacian

- $\nabla^2 I(x,y)$  is a SCALAR
  - ↑ Can be found using a SINGLE mask
  - ↓ Orientation information is lost
- $\nabla^2 I(x,y)$  is the sum of SECOND-order derivatives
  - But taking derivatives increases noise
  - Very noise sensitive!

# Laplacian of Gaussian (LoG) Filter

- First smooth with a Gaussian filter
- Then apply the Laplacian filter

$$O(x,y) = \nabla^2(I(x,y) * G(x,y))$$

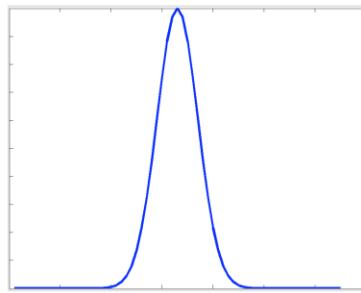

$$\nabla^2(f(x,y) \otimes G(x,y)) = \nabla^2 G(x,y) \otimes f(x,y)$$

Laplacian of  
Gaussian-filtered image

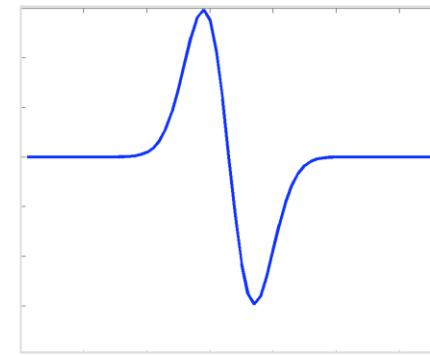

Laplacian of Gaussian (LoG)  
-filtered image

# 1D Gaussian and Derivatives

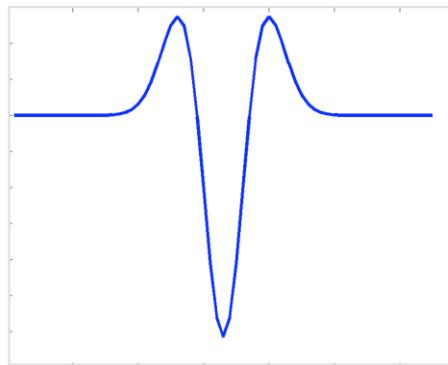

$$g(x) = e^{-\frac{x^2}{2\sigma^2}}$$

$$g'(x) = -\frac{1}{2\sigma^2} 2xe^{-\frac{x^2}{2\sigma^2}} = -\frac{x}{\sigma^2} e^{-\frac{x^2}{2\sigma^2}}$$

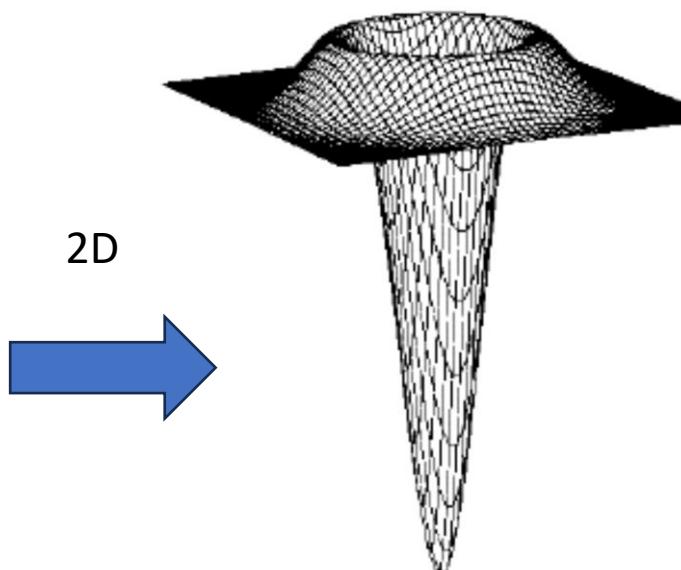

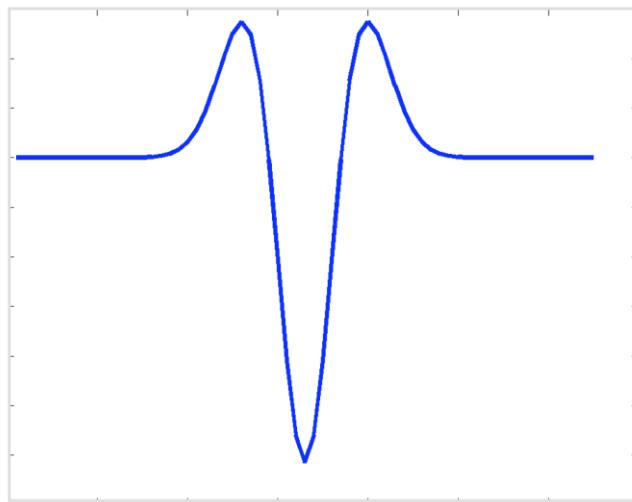

$$g''(x) = \left(\frac{x^2}{\sigma^4} - \frac{1}{\sigma^2}\right) e^{-\frac{x^2}{2\sigma^2}}$$

# Second Derivative of Gaussian

$$g''(x) = \left(\frac{x^2}{\sigma^4} - \frac{1}{\sigma^2}\right)e^{-\frac{x^2}{2\sigma^2}}$$

$\nabla^2 h_\sigma(u, v)$

Laplacian of Gaussian

Mexican Hat Function

# Laplacian of Gaussian Filter

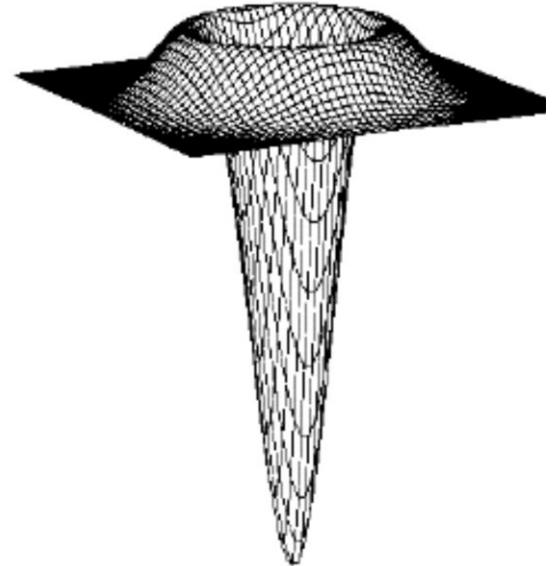

$$\nabla^2 \mathbf{I} = \frac{\partial^2 \mathbf{I}}{\partial x^2} + \frac{\partial^2 \mathbf{I}}{\partial y^2}$$

$$\nabla^2 \mathbf{I} \circ g = \nabla^2 g \circ \mathbf{I}$$

$$\nabla^2 g = \frac{x^2 + y^2 - 2\sigma^2}{\sigma^4} g(x, y)$$

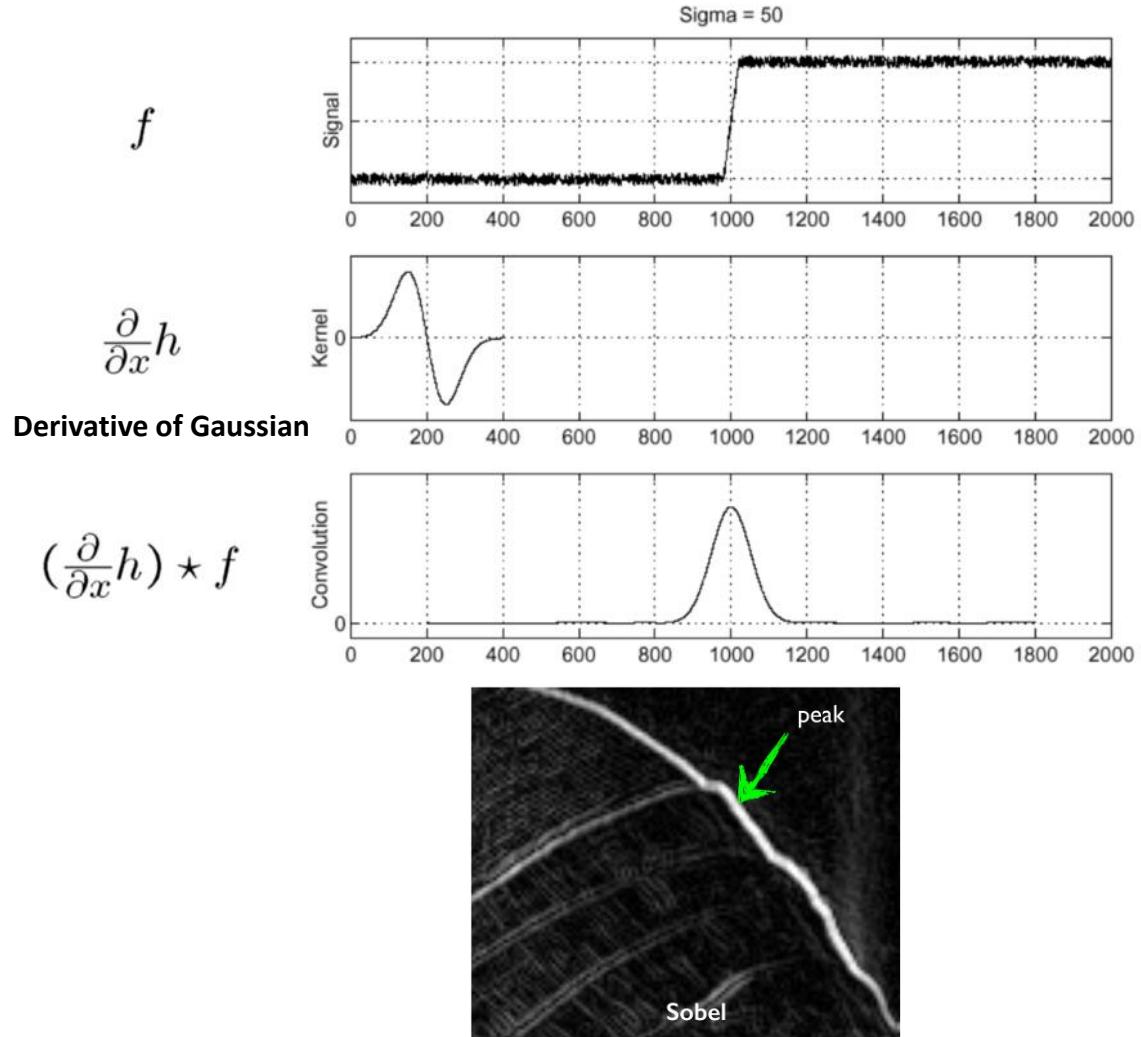

Smoothing and second derivative

$$\nabla^2 h_\sigma(u, v)$$

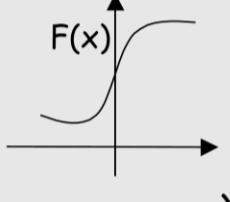

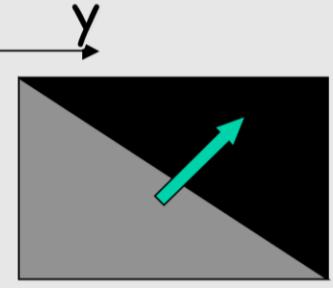

Laplacian of Gaussian

# Laplacian of Gaussian Filter

# Edge Detection with LoG

1D		2D
$I(x)$		$I(x,y)$ 
$\frac{dI(x)}{dx} > Th$		$ \nabla I(x,y)  = (\partial_x^2 I(x,y) + \partial_y^2 I(x,y))^{1/2} > Th$ $\tan \theta = \partial_x I(x,y) / \partial_y I(x,y)$
$\frac{d^2 I(x)}{dx^2} = 0$		$\nabla^2 I(x,y) = \partial_{xx} I(x,y) + \partial_{yy} I(x,y) = 0$ Laplacian

# Zero-Crossing as an Edge Detector

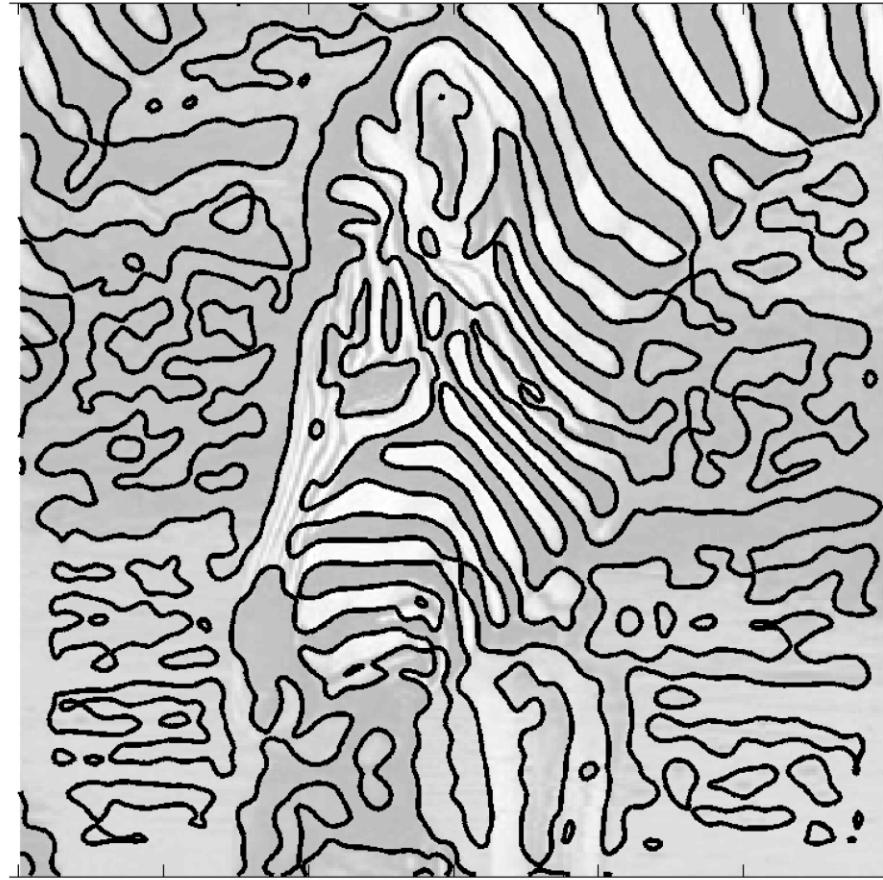

Raw zero-crossings (no contrast thresholding)

LoG  $\sigma = 2$ , zero-crossing

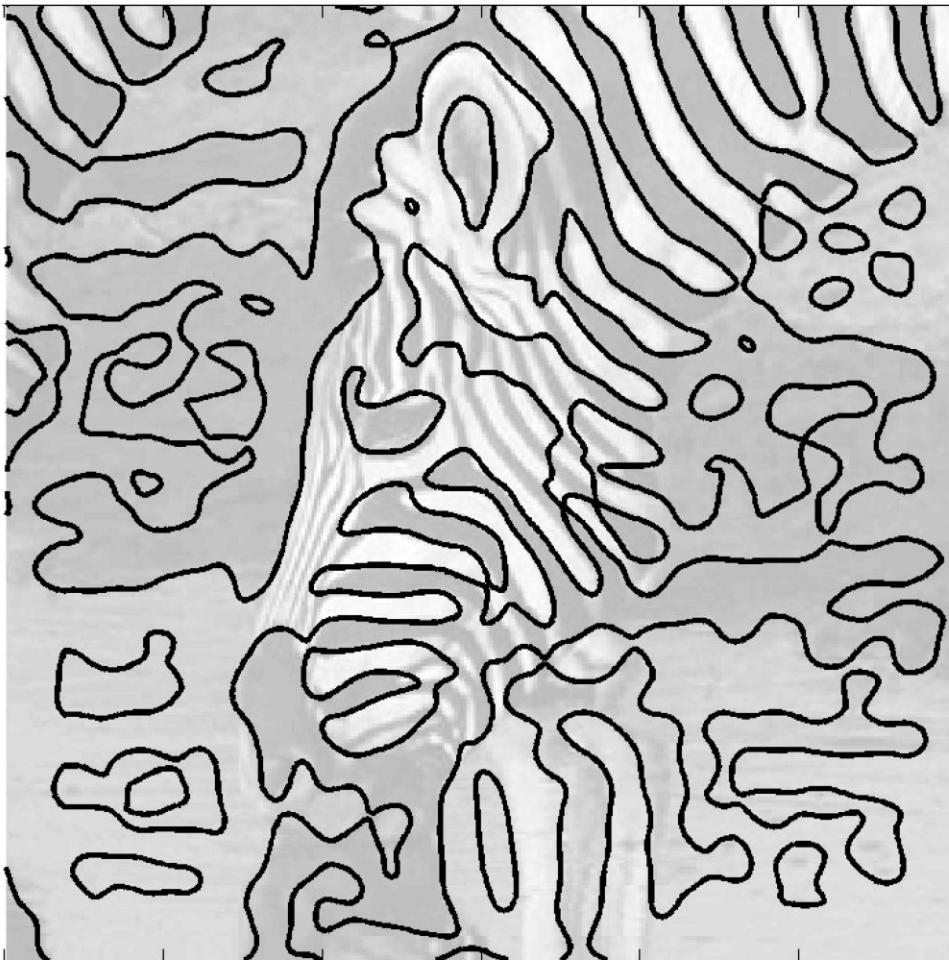

# Zero-Crossing as an Edge Detector

Raw zero-crossings (no contrast thresholding)

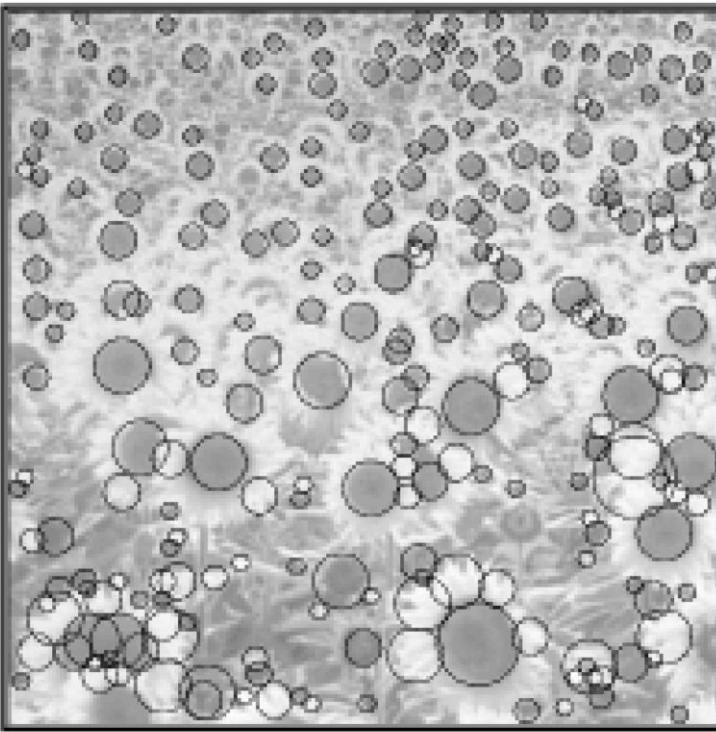

LoG sigma = 4, zero-crossing

# Zero-Crossing as an Edge Detector

LoG sigma = 8, zero-crossing

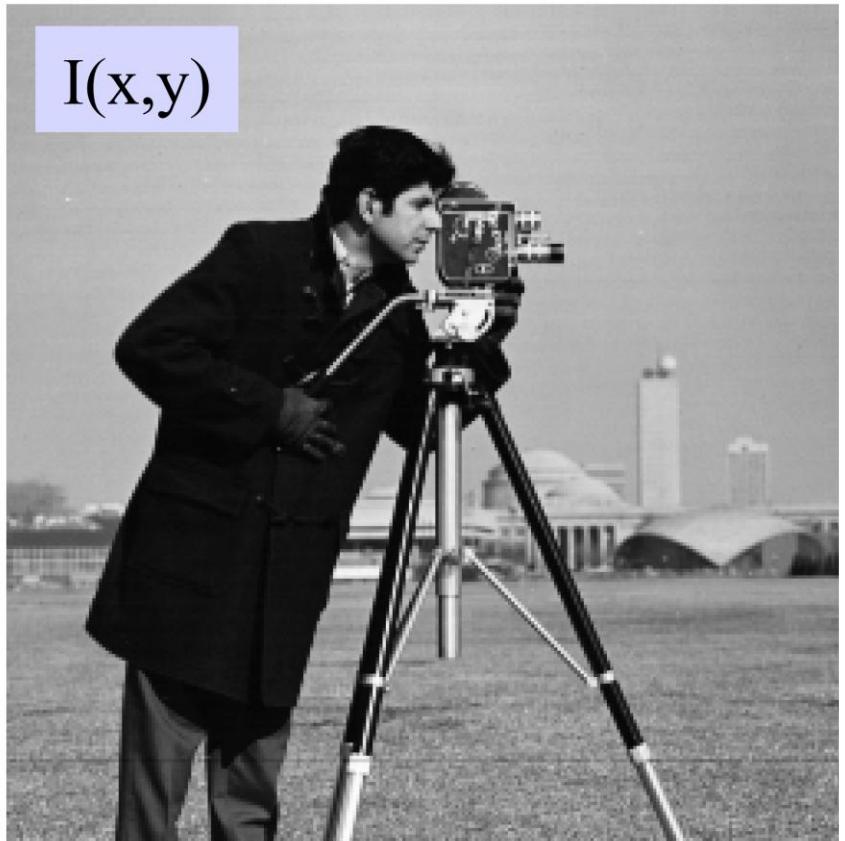

# Blob Detection with LoG

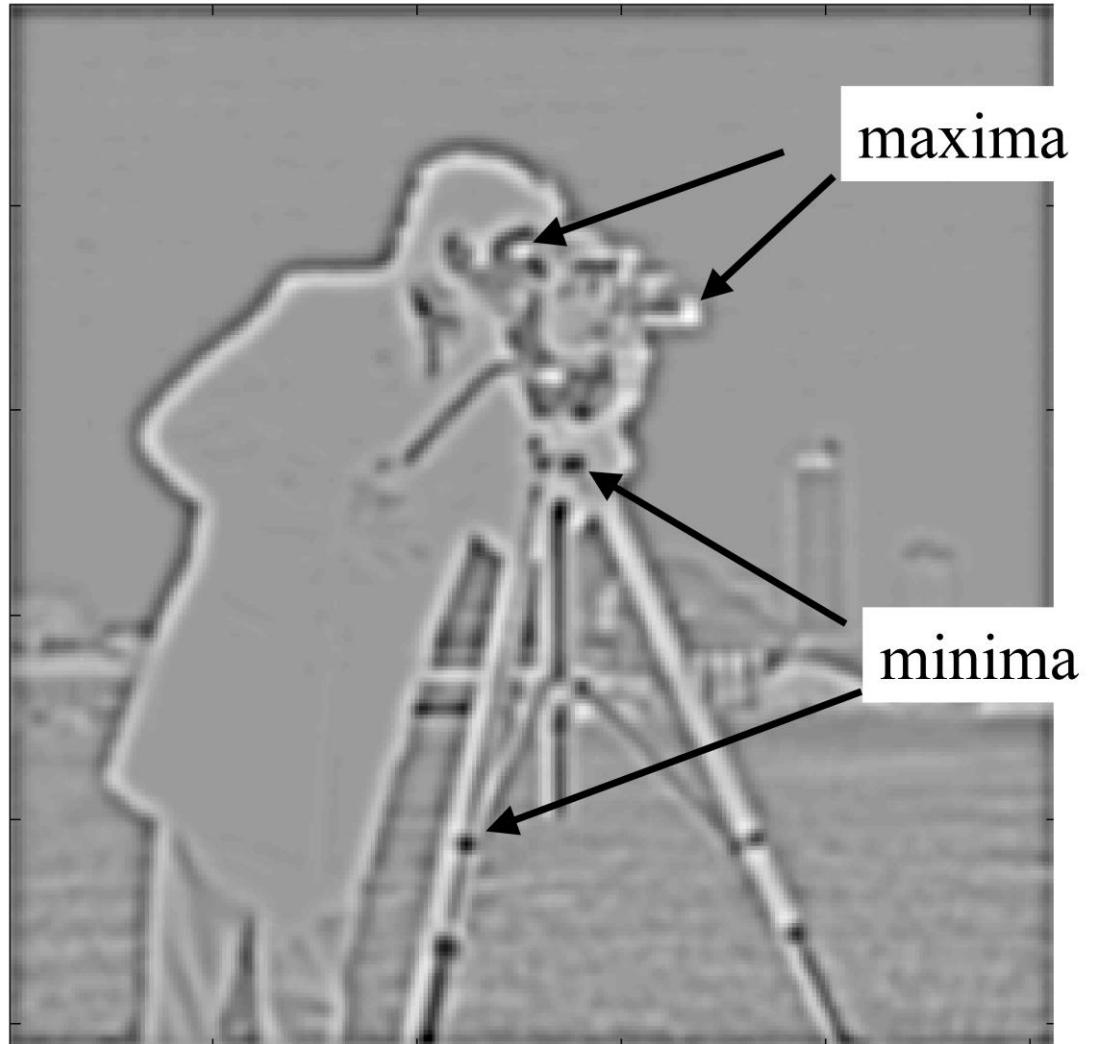

Lindeberg: ``Feature detection with automatic scale selection''. International Journal of Computer Vision, vol 30, number 2, pp. 77--116, 1998.

# Example: LoG Extrema

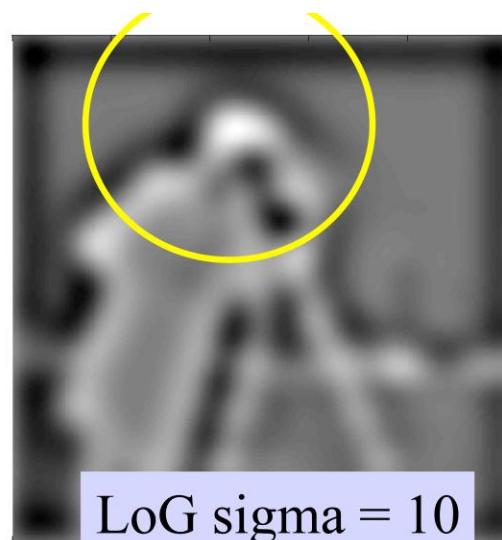

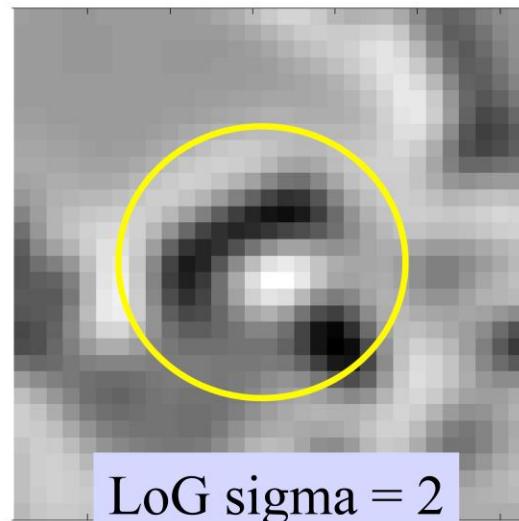

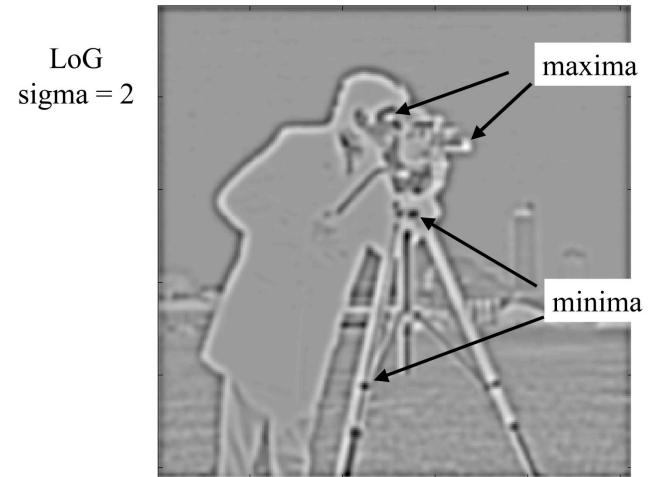

LoG  
sigma = 2

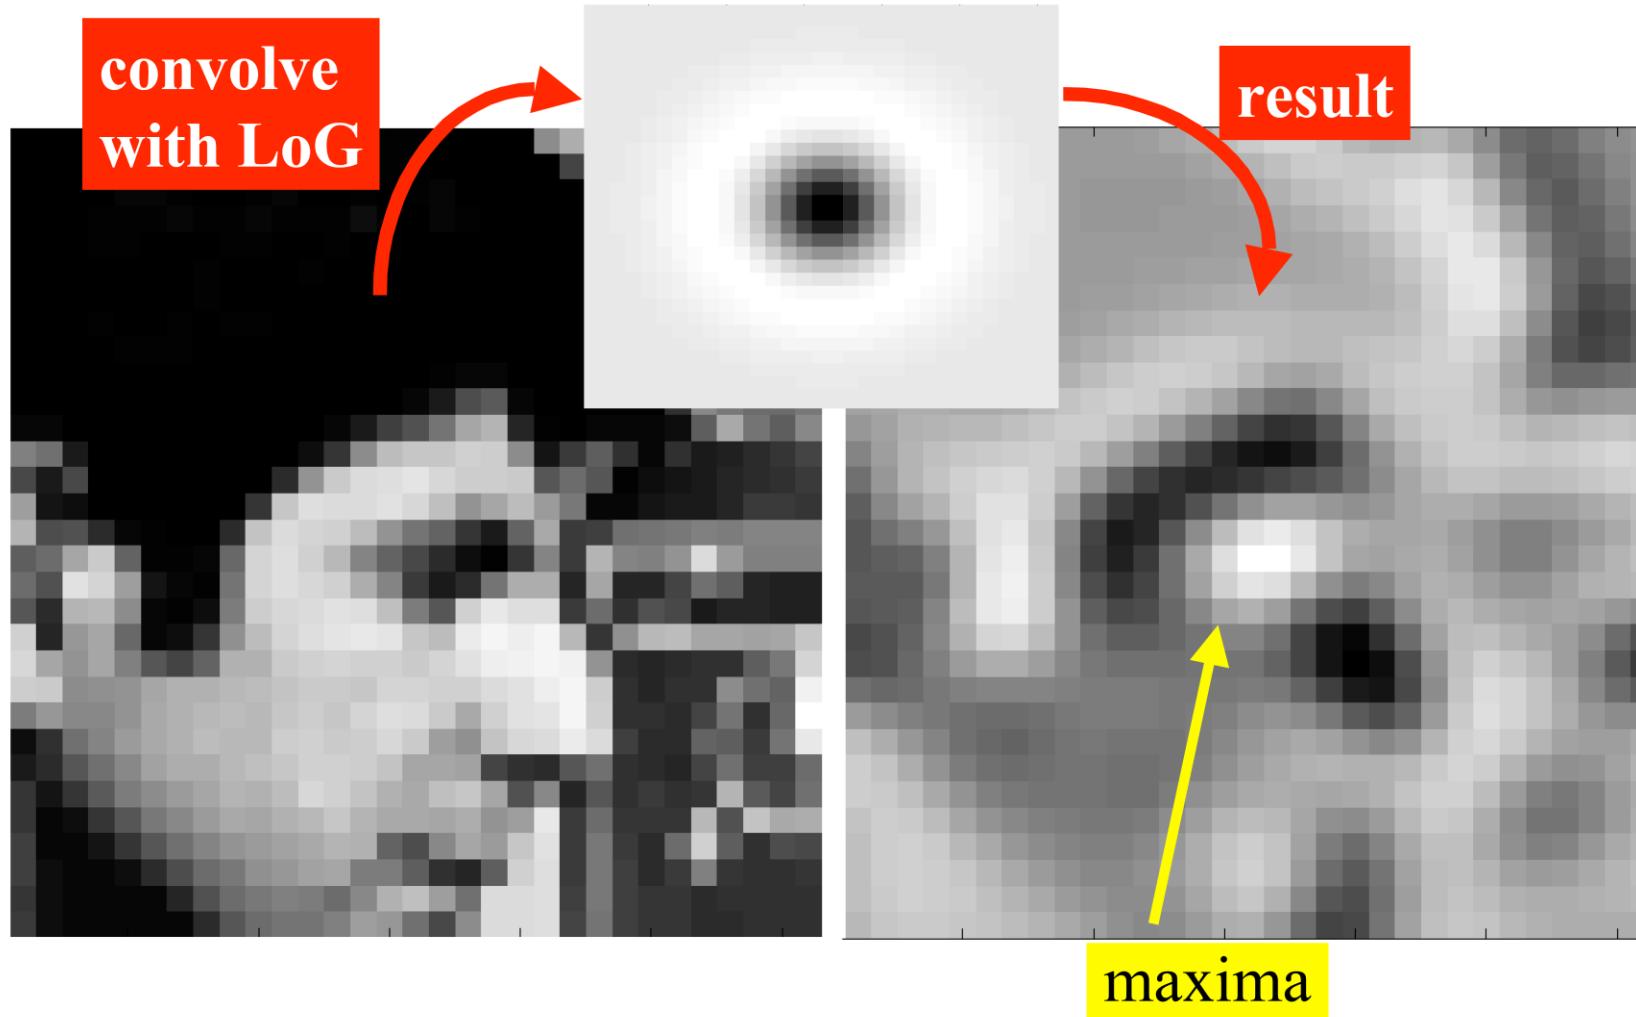

# LoG Blob Detection

- LoG filter extrema locates “blobs”
  - Maxima: dark blobs on light background
  - Minima: light blobs on dark background
- Scale of blob (size ; radius in pixels) is determined by the sigma parameter of the LoG filter

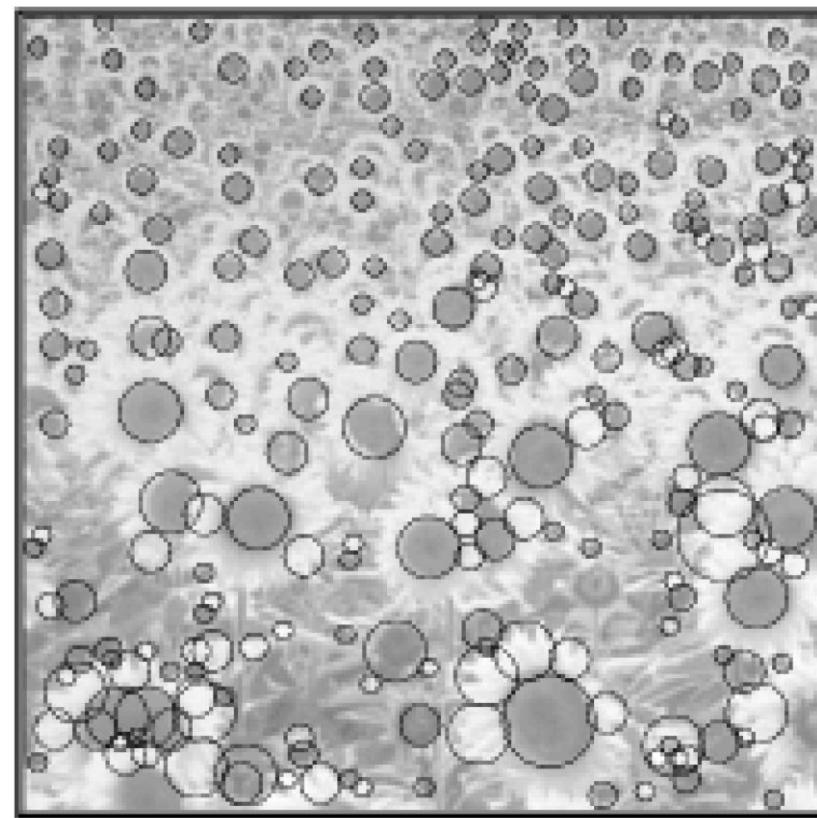

# LoG Blob Detection

Convolution (and cross correlation) with a filter can be viewed as comparing a little “picture” of what you want to find against all local regions in the mage.

# LoG Blob Detection

Lindeberg: blobs are detected as local extrema in space and scale, within the LoG scale-space volume.
